The gene-centric view separates the organism from its environment, and in large part, removes agency from the organism. The 'environment' becomes a box within which 'gene-motivated' organisms behave. Thus, it misleadingly partitions 'genetic' from 'environmental' causes, giving primacy to the former. Therefore, altruism is denied because 'in reality' organisms behave to enhance their genes in the 'gene pool' — and love, hate, desires and other motivations flow through and from genes. With this there can be no creativity. The organism is a prisoner of its genes. This is evidently nonsense because, if there is a prisoner, it must be the genes, locked in the organism and obeying its will. It is the organism as a self-organising entity that has motivation and uses genes in its capacity to act. The word 'organism' has its origins in defining organisms as self-organising beings, going back at least to Immanuel Kant's 1790 Critique of Judgement. The gene-centric view strips the organism of its definitive self.
